

# Biofuels

Prof. Johan E. Hustad

Department of Energy and Process Engineering  
NTNU  
Norway

# Biofuels are hot again - this time it's the global warming

# Outline

- **Introduction**
  - Characterisation, resources
  - Fuel prices, trade, politics
- **Process routes and options**
- **Technologies and cycles**
  - Combustion/Co-combustion
  - Gasification/gasification-combustion
- **Producer gas impurities and gas/particle cleaning**
- **Examples of projects at NTNU/Sintef**
- **Biofuels for transport**
- **Poly/tri-generation biomass systems**
- **Conclusions**

# Biofuels – some examples

---

## Wood

## Pellets

## Chips

## Charcoal

# Brenselanalyser

---

## Direkte Analyse (*Proximate Analysis*)

- Fuktighet (*moisture content*) [vekt%]
- Flyktige Bestanddeler (*volatile matter*) [vekt%]
- Fast Karbon (*fix-C*) [vekt%]
- Aske (*ash*) [vekt%]

Analysen gjøres på rått brensel

## Elementanalyse (*Ultimate Analysis*)

- Karbon                    C                    [vekt%]
- Hydrogen                H                    [vekt%]
- Oksygen                                    O                    [vekt%]
- Nitrogen                                    N                    [vekt%]
- Svovel                    S                    [vekt%]

Analysen gjøres på tørr og askefri basis (DAF)

## Brennverdi (*Heating Value*) [MJ/kg]

Main properties of coal, natural gas and various woody and herbaceous raw materials and feedstocks

|                            | Bituminous Coal | Natural gas        | Wood <sup>8</sup> | Bark      | Willow            | Forest residues <sup>10</sup> | Wood chips                     | Wood pellets | Cereal straw          | Dedicated energy crops |
|----------------------------|-----------------|--------------------|-------------------|-----------|-------------------|-------------------------------|--------------------------------|--------------|-----------------------|------------------------|

# Three different technologies will coexist for production of biofuels

# Both agricultural and wood based materials are involved in biofuels production

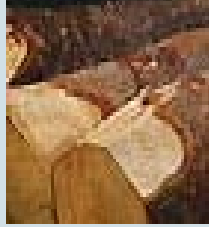

### Bioethanol

|   |   |   |   |
|---|---|---|---|
|  |  |  |  |
| <b>Sugar cane</b>   | <b>Sugar beet</b>   | <b>Corn</b>   | <b>Wheat</b>  |
| Brazil, India, China, Colombia  | Europe, China   | US, China   | Europe, India, China, US  |

### Biodiesel

|   |   |   |
|---|---|---|
|  |  |  |
| <b>Rapeseed</b>   | <b>Palm</b>   | <b>Jatropha</b>   |
| Europe, Canada, China, Russia   | Indonesia, Malaysia, Nigeria  | Africa, South Eastern Asia, India   |

### Biomass to liquids (Second generation)

|   |   |  |   |   |
|---|---|--|---|---|
|  |  |  |  |  |
| <b>Switchgrass</b>  | <b>Miscanthus</b>   | <b>Bagasse</b>   | <b>Straw</b>  | <b>Wood</b>   |

# Bioethanol and biodiesel have different properties

## Bioethanol

- $\text{CH}_3\text{CH}_2\text{OH}$
- Can be blended with gasoline (up to ~10%) or used in special cars
- Commercially available
- Brazil is the largest consumer

## Biodiesel

- Depends on raw material, typically  $\text{C}_{10}\text{H}_{22}$  to  $\text{C}_{15}\text{H}_{32}$
- Can be used in today's diesel cars
- Commercially available from agricultural crops
- Germany is the largest consumer

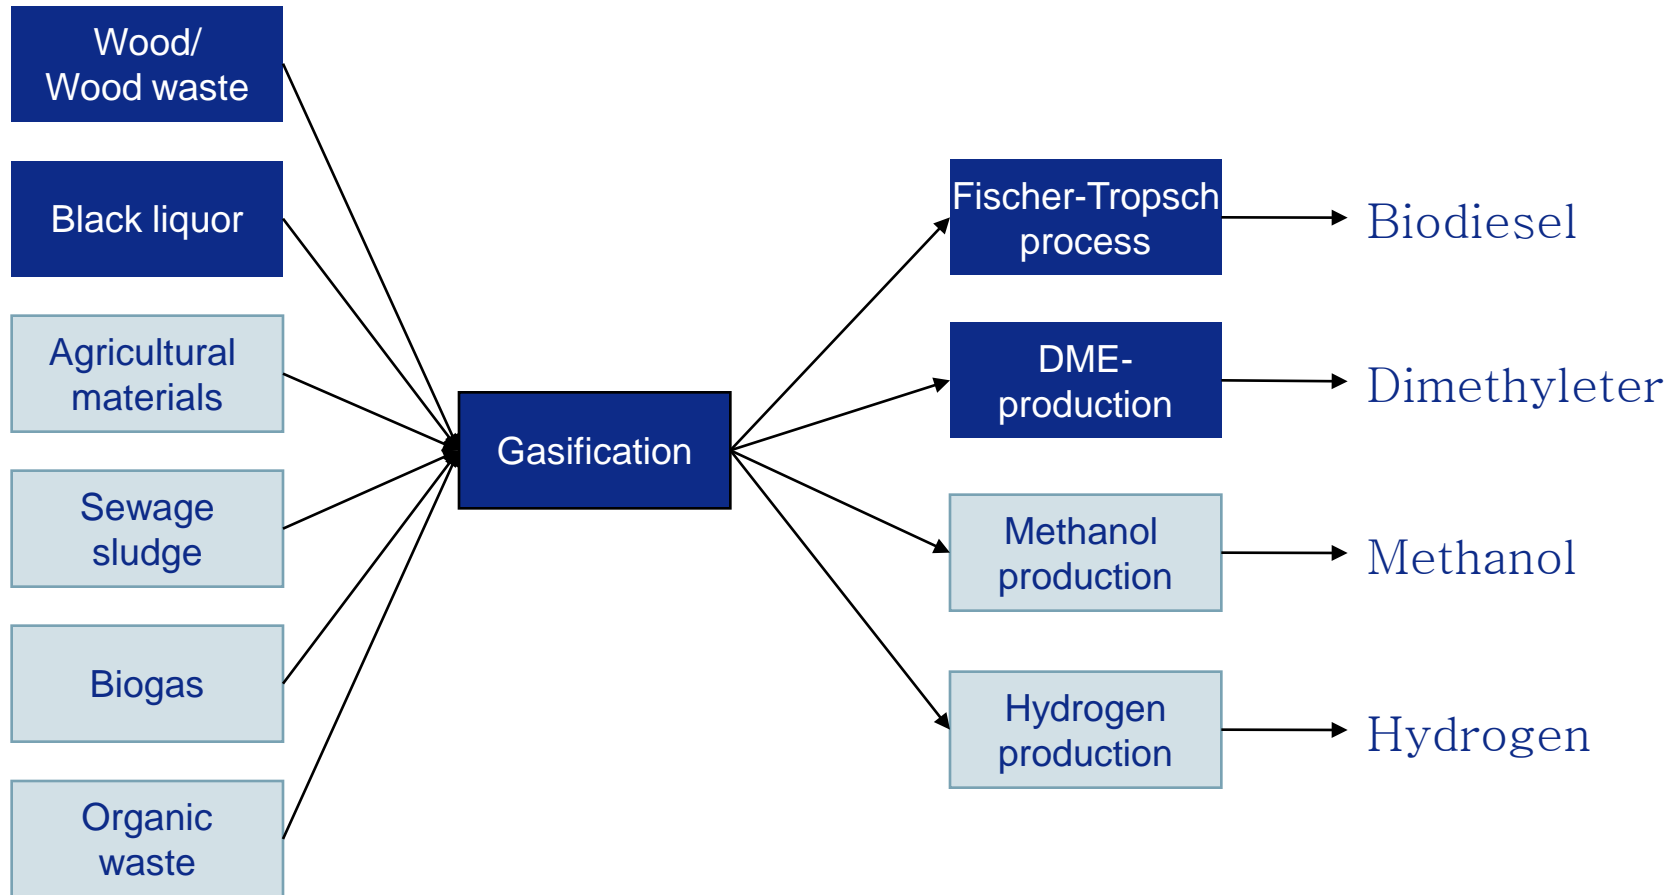

# World production of bioethanol eight times that of biodiesel

Production of bioethanol dominated by Brazil and US    Production of biodiesel dominated by Europe

2006:

Cobalt

**Biomass gasification**

**Biomass**

**BioSNG-production**

**BioFiT- liquid fuel production**

- Biofuels can be utilised in a large range of processes and by the use of many different technologies at different scales.
- Biofuels will play an increased importance in the energy system in the future.
- Biofuels is the only renewable energy resource which can be used in both heat, electricity and transport applications.
- The most important processes will be combustion and gasification.
- Combustion and co-combustion will be most important for heat, power and CHP applications.
  - Particles, UHC, CO small plants
  - Fouling/slagging (Cl, K, S, Na) larger plants
- Gasification/combustion/co-gasification can be the source of both (heat), electricity and transport fuels including hydrogen
  - Gas cleaning like tars, H<sub>2</sub>S, particles, alkali metals and chlorine compounds
- Gasification also has the potential for advanced processes like high temperature fuel cells.
