

***Emergent Properties of the Cytoskeleton: Molecules to Cells***

***3-8 October 2010***

***Hotel Eden Roc, Sant Feliu de Guixols, Spain***

The Emergent properties of the cytoskeleton: molecules to cells conference was organized by European Science Foundation (ESF) and European Molecular Biology Organization (EMBO) in the beautiful environment at the coast of Spain. The aims of the five day conference were to address the best and the newest developments in the cytoskeleton research and to bring researchers with different scientific backgrounds together to discuss the topics of this area.

The conference consisted of five sessions with different themes including myosin structure and function, actin dynamics and organization, forces and cell adhesion in biology, force generation and cellular transport and microtubules and motors. Altogether, 55 talks were heard. There were also two long poster sessions and a special time for group discussions. I presented my poster in the meeting. The conference was excellent, interesting and well organized.

I thank ISB for the financial support.
